

# Rising Waters: Flood Prediction Using Machine Learning

## SMARTBRIDGE INTERNSHIP PROJECT REPORT

**Project Title:** Flood Risk Prediction Using Machine Learning

**Technology:** Python, Flask, HTML, CSS

**Team Id:** LTVIP2026TMIDS37461

**Student Name:** M.Guruchaithanya kumari

**Roll Number:** 22F11A05G0

**College:** Narayana Engineering College, Gudur

**Year:** 2026

## **TABLE OF CONTENTS**

1. Abstract
2. Introduction
3. Problem Statement
4. Objectives
5. Dataset Description
6. Machine Learning Model
7. Web Application
8. Working Of Web Application
9. HTML Pages Used
10. Advantages
11. Applications
12. Future Enhancements
13. Conclusion

## 1. ABSTRACT

Floods are one of the most dangerous natural disasters that cause severe damage to human life, agriculture, and infrastructure. Early prediction of floods helps authorities take preventive measures and reduce losses. This project focuses on predicting flood occurrence using Machine Learning techniques.

The system analyzes environmental parameters such as temperature, humidity, cloud cover, rainfall distribution, and seasonal weather values. A Random Forest classification model is trained using historical flood data to determine whether flood risk exists or not.

A Flask-based web application is developed to allow users to enter weather parameters and obtain flood prediction results instantly. The application displays either **High Flood Risk** or **No Flood Risk** based on the trained model output.

This project demonstrates how machine learning can be applied to real-world disaster prediction problems.

## **2. INTRODUCTION**

Flood prediction is a crucial task in disaster management systems. Traditional flood monitoring methods rely on manual observation and delayed reporting, which often leads to late warnings.

With the advancement of Machine Learning, it is possible to analyze large amounts of historical weather data and identify patterns that indicate flood risk.

This project builds a predictive model that:

- Learns from past flood data
- Identifies relationships between weather conditions
- Predicts flood chances automatically

A web interface is provided so that users can easily input data and view predictions.

## **3. PROBLEM STATEMENT**

Rising Waters: A Machine Learning Approach to Flood Prediction Flood Prediction using Machine Learning is a vital application that aims to forecast and predict flood occurrences with high accuracy. By analyzing historical weather data, river levels, terrain information, and other relevant factors using machine learning algorithms, this project helps in early warning and mitigation of potential flood events. The goal is to provide timely alerts and actionable insights to authorities, communities, and individuals to minimize the impact of floods on lives and infrastructure.

Floods cause:

- Loss of human lives
- Damage to property
- Crop destruction
- Economic instability

Existing systems often:

- Provide late warnings

- Require manual calculations
- Lack automated prediction tools

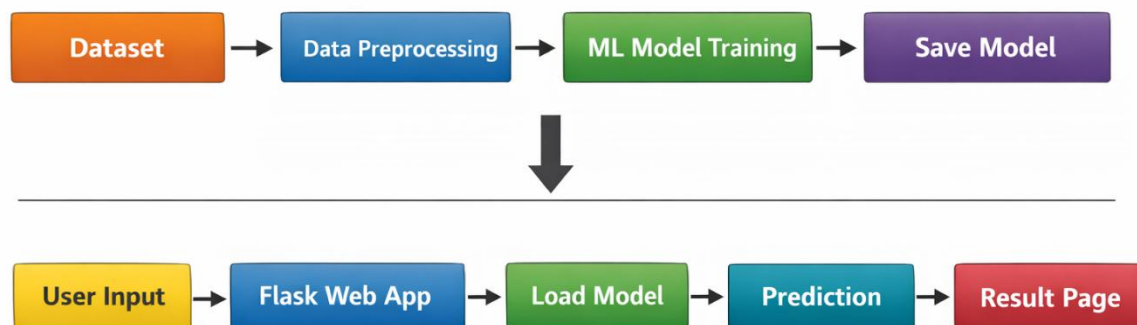

Therefore, there is a need for an automated flood prediction system using machine learning.

#### 4. OBJECTIVES

Main objectives of this project:

- Build a machine learning model for flood prediction
- Train the model using historical dataset
- Create a user-friendly web application
- Provide instant flood risk results
- Help in disaster preparedness

#### 5. SYSTEM ARCHITECTURE

## **6. TECHNOLOGIES USED**

### **1. Python**

Python is the main programming language used to develop the flood prediction system. It is easy to use and supports many libraries for machine learning and web development.

### **2. Pandas**

Pandas library is used for loading, reading, and processing the dataset. It helps in handling tabular data efficiently.

### **3. NumPy**

NumPy is used for numerical operations and converting user input values into arrays for model prediction.

### **4. Scikit-learn**

Scikit-learn is used to build and train the machine learning model. The Random Forest classifier from this library is used for flood prediction.

### **5. Pickle**

Pickle module is used to save the trained machine learning model into a file so it can be reused later in the Flask application.

### **6. Flask**

Flask is a lightweight web framework used to create the web application interface. It connects the trained model with HTML pages and processes user input.

### **7. HTML & CSS**

HTML is used to design the structure of the web pages, while CSS is used to style the pages and improve the visual appearance.

### **8. VS Code**

Visual Studio Code is used as the development environment for writing and running Python and Flask code.

## **7. DATASET DESCRIPTION**

The dataset contains environmental parameters:

- Temperature
- Humidity
- Cloud Cover
- Annual rainfall
- Seasonal rainfall distribution
- Average June rainfall
- Sub-division rainfall

Target column:

- Flood (0 = No Flood, 1 = Flood)

This dataset is used to train the machine learning model.

## **8. DATA PREPROCESSING**

Steps performed:

1. Dataset loaded using pandas
2. Features separated from target column
3. Training and testing data split
4. Missing values handled if present

## **9. MACHINE LEARNING MODEL**

Random Forest Classifier is used.

**Why Random Forest?**

- High accuracy

- Works well with multiple features
- Handles large datasets
- Prevents overfitting

The model learns patterns from historical data and predicts flood probability.

## **10. MODEL TRAINING PROCESS**

Steps:

1. Load dataset
2. Separate X and Y
3. Split into training/testing
4. Train RandomForestClassifier
5. Save model using pickle

Saved file:

model.pkl

## **11. WEB APPLICATION DEVELOPMENT**

A Flask application is created.

The web system includes:

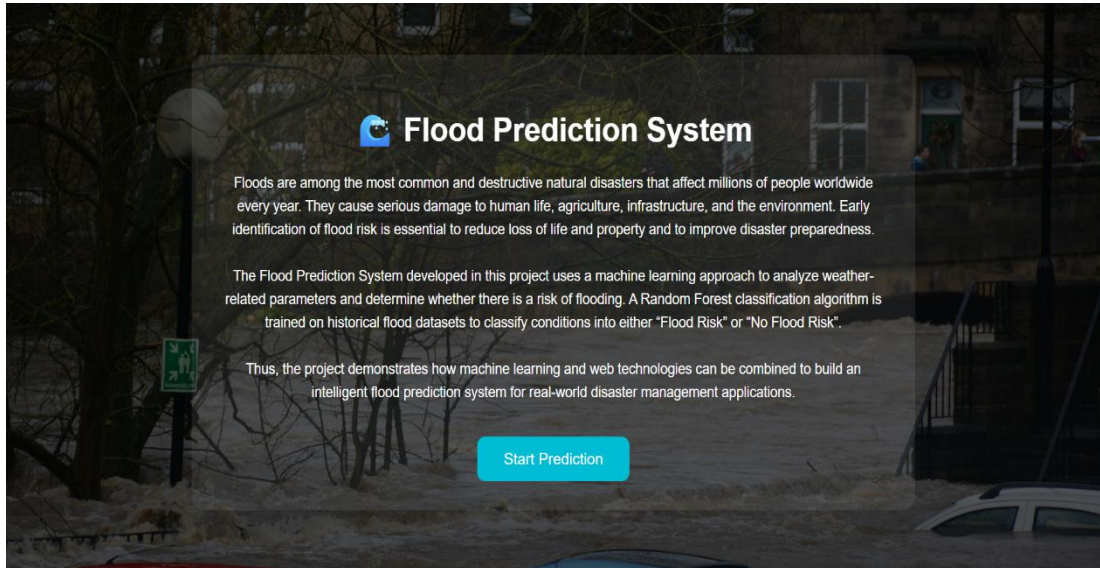

- Home Page
- Input Page
- Flood Risk Page
- Safe Page

## 12. WORKING OF WEB APPLICATION

### 1. User opens home page

The user first accesses the flood prediction web application through the browser. The home page provides a brief introduction about the system and an option to start the prediction process.

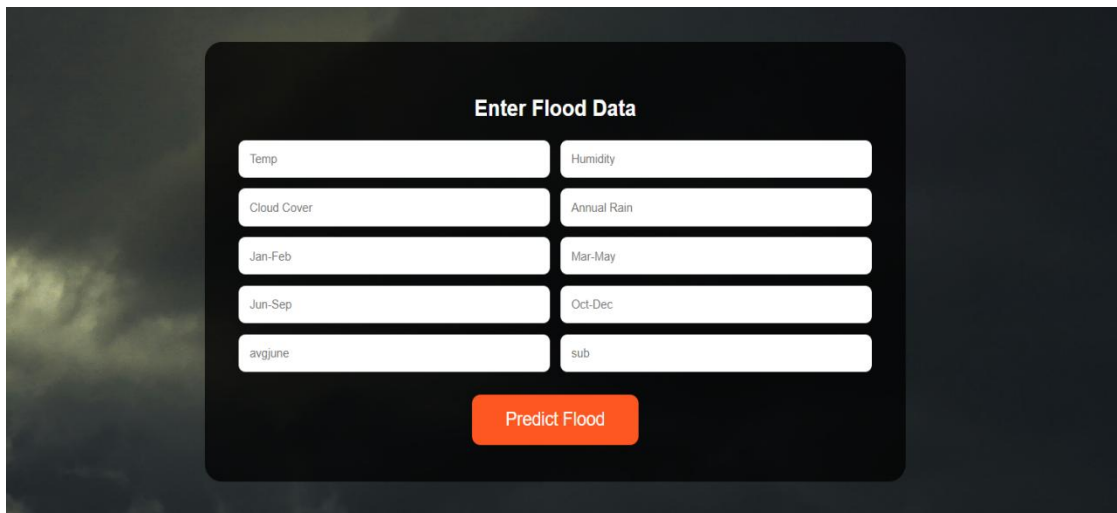

### Home Page of Flood Prediction System

### 2. Clicks prediction option

The user clicks the prediction button or link available on the home page. This redirects the user to the input form page where weather parameters can be entered.

### 3. Enters weather values

The user enters required environmental values such as temperature, humidity, rainfall distribution, cloud cover, and other seasonal data into the input fields provided on the form.

The image shows a web form titled "Enter Flood Data" on a dark background with a cloudy sky image. The form contains ten input fields arranged in two columns. The left column has fields for "Temp", "Cloud Cover", "Jan-Feb", "Jun-Sep", and "avgjune". The right column has fields for "Humidity", "Annual Rain", "Mar-May", "Oct-Dec", and "sub". Below the input fields is a red button labeled "Predict Flood".

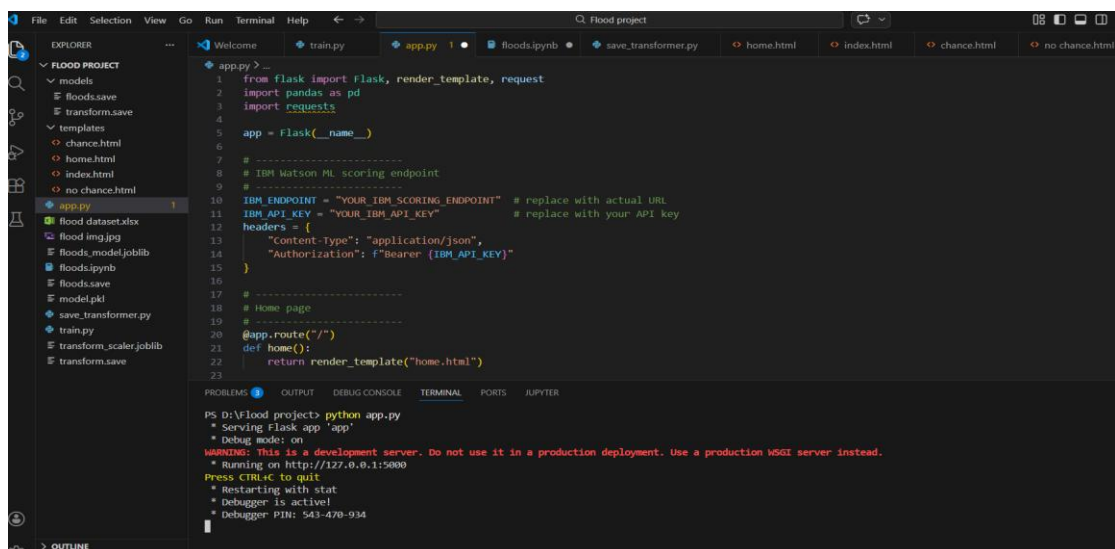

## User Input Page

### 4. Flask sends data to model

After submitting the form, the Flask backend collects the entered values, converts them into numerical format, and sends them to the trained machine learning model for analysis.

### 5. Model predicts result

The trained Random Forest model processes the input values and compares them with patterns learned from historical flood data to determine whether there is a flood risk.

The image shows a screenshot of the Visual Studio Code (VS Code) interface. The Explorer panel on the left shows a project named "FLOOD PROJECT" with files like "floods.save", "transform.save", "templates", "chance.html", "home.html", "index.html", and "no chance.html". The main editor area shows the "app.py" file with the following code:

```

1 from flask import Flask, render_template, request
2 import pandas as pd
3 import requests
4
5 app = Flask(__name__)
6
7 # IBM Watson ML scoring endpoint
8 #
9 #
10 IBM_ENDPOINT = "YOUR_IBM_SCORING_ENDPOINT" # replace with actual URL
11 IBM_API_KEY = "YOUR_IBM_API_KEY" # replace with your API key
12 headers = {
13     "Content-Type": "application/json",
14     "Authorization": f"Bearer {IBM_API_KEY}"
15 }
16
17 # Home page
18 #
19 #
20 @app.route("/")
21 def home():
22     return render_template("home.html")
23

```

The TERMINAL panel at the bottom shows the command prompt output:

```

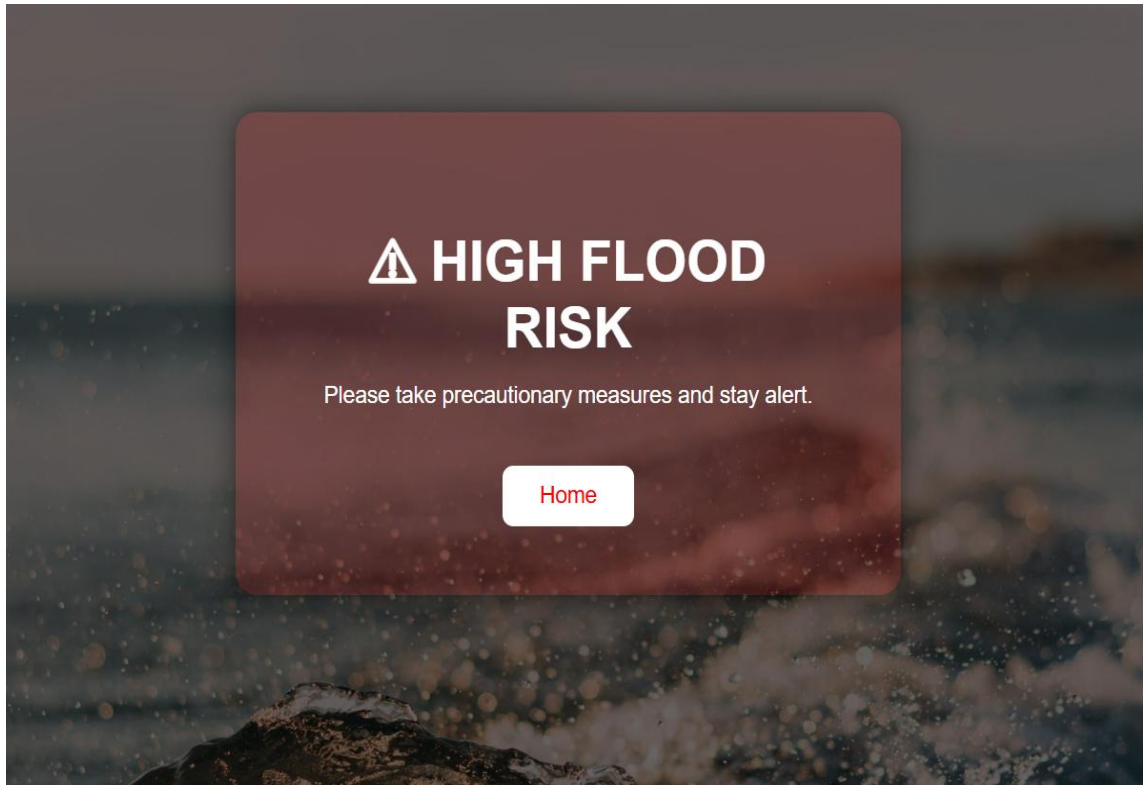

PS D:\Flood project> python app.py
* Serving Flask app 'app'
* Debug mode: on
WARNING: This is a development server. Do not use it in a production deployment. Use a production WSGI server instead.
* Running on http://127.0.0.1:5000
Press CTRL+C to quit
* Restarting with stat
* Debugger is active
* Debugger PIN: 543-478-934

```

## Project Execution in VS Code

#### 6. Result page displayed

Based on the prediction, the system displays the appropriate result page showing either **High Flood Risk** or **No Flood Risk**, allowing the user to understand the situation instantly.

**High Flood Risk Prediction Output**

**No Flood Risk Prediction Output**

#### **14. ADVANTAGES**

- Fast prediction
- Easy to use
- Reduces disaster risk
- Supports planning
- Fully automated

#### **15. APPLICATIONS**

- Disaster management departments
- Weather monitoring agencies
- Government planning
- Agricultural protection
- Urban development

## **16. FUTURE ENHANCEMENTS**

Future improvements:

- Real-time weather API integration
- Mobile application version
- Map-based flood visualization
- Deep learning model
- SMS alert system

## **17. CONCLUSION**

This project successfully demonstrates a flood prediction system using machine learning and Flask web technology. The trained Random Forest model can analyze weather parameters and predict flood risk effectively.

The system can help authorities and communities take early preventive measures and reduce damage caused by floods.

This Machine Learning based Flood Prediction System helps to forecast possible flood situations using environmental data such as temperature, humidity, rainfall and seasonal values.

The system analyses the given inputs and predicts whether there is a possibility of flood occurrence or not.

This project helps authorities and communities to take early precautionary measures and reduce damage caused by floods.
